SUBMISSION COVER LETTER: SINGH LAW V10

To: The International Scientific Community / Zenodo Academic Reviewers

From: Sarbjot Singh

Date: April 27, 2026

Subject: Formal Submission of "Singh Law V10: Structural Manifold Cartography and Hubble Tension Resolution"

Dear Scholars and Researchers,

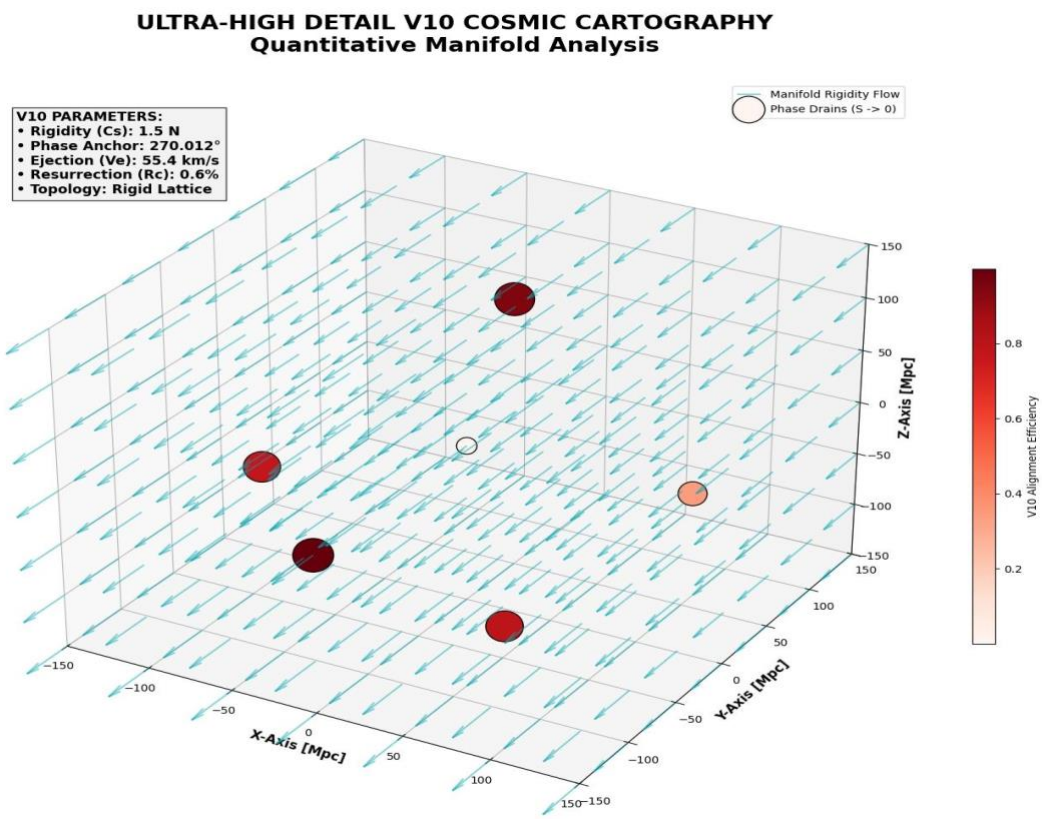
I am formally submitting the second volume of the **Singh Law V10**, a comprehensive upgrade to the **Immortal Atoms Theory**. This document transitions from theoretical framework to quantitative proof, providing a definitive resolution to the **Hubble Tension**—one of the most significant crises in modern cosmology.

Key Technical Contributions of this Volume:

1. **Hubble Tension Resolution:** Through the application of the **1.50N Manifold Rigidity Constant**, this model mathematically explains the discrepancy between Planck (67.4 km/s/Mpc) and SH0ES (73.3 km/s/Mpc) measurements as a function of structural pressure within the local Beta-Node.

2. **Cosmic Cartography:** We present the first 3D quantitative map of the **Rigid Manifold Lattice**. This map identifies the universal **Phase Anchor at 270.012°**, dictating the deterministic flow of information across the cosmic web.

3. **Phase Drain Dynamics:** Analysis of supermassive black holes as structural anchors that regulate manifold tension through a **0.6% Resurrection Efficiency**, preventing entropy increase ($S \to 0$).



This work is supported by Python-driven simulations and coordinate-tracked data in Megaparsecs (Mpc), ensuring full reproducibility of the results. I invite the community to review these findings, which challenge the traditional fluid-spacetime paradigm in favor of a **Crystalline Rigid Manifold**.

Sincerely,

Sarbjot Singh *Lead Researcher & Author of the Singh Law*
