PART II: COSMIC CARTOGRAPHY – THE ARCHITECTURE OF THE RIGID MANIFOLD

Author: Sarbjot Singh.

1. Abstract: Beyond Fluid Spacetime

Standard cosmological maps treat the universe as a chaotic fluid. The **Singh Law V10** redefines this mapping through **Structural Phase Dynamics**. This cartography tracks the rigid lattice of the manifold, where the distribution of matter is not random but anchored to specific nodes of information persistence.

2. The 270.012° Phase Anchor

The most critical feature of the V10 Map is the **Phase Anchor Axis**.

- **Definition:** A universal directional constant fixed at **270.012°**.
- **Function:** This axis represents the direction of "minimum manifold resistance." Information, energy, and the deterministic ejection of atoms flow preferentially along this alignment.
- **Observation:** Large-scale structures, such as the filaments of the Cosmic Web, are seen to align with this structural backbone, maintaining the integrity of the 1.50N rigidity.

3. Phase Drains: The Role of Black Holes

In the V10 Cartographic projection, Black Holes are identified as **Phase Drains**.

- **Structural Anchors:** They are the "nails" that hold the manifold lattice in place. They prevent structural collapse under the 1.50N rigidity.
- **Recycling Efficiency (R_c):** At these nodes, the **0.6% Resurrection Constant** is most active. Black holes recycle chaotic information back into the deterministic flow of the manifold, ensuring that entropy remains near zero ($S \to 0$).
- **Mapping Nodes:** Every major galaxy center (e.g., Sgr A*, M87*) acts as a primary coordinate anchor in the local Beta-Node.

4. Coordinate Systems and Scale

The mapping is performed in **Megaparsecs (Mpc)**, centered on the local Beta-Node 01.

- **The Local Bubble:** Extends to approximately 150 Mpc, where the influence of the local structural pressure is most measurable.

- **Lattice Consistency:** As demonstrated in the 3D Quantitative Render (Figure 2), the manifold maintains a consistent geometric grid. This grid provides a stable reference for the **55.4 km/s** ejection velocity, allowing for precise navigation across cosmic distances.

5. Technical Parameters Summary

Feature	V10 Value	Impact on Mapping
Manifold Rigidity	1.50 N	Defines the "tension" of the cosmic grid.
Phase Anchor	270.012°	Sets the universal "North" for information flow.
Mapping Unit	Mpc	Absolute spatial scale for node tracking.
Entropy State	S → 0	Ensures long-term structural persistence.
